Outline				

- Blind image deconvolution
- Deep image prior
- SelfDeblur DIP in BID
- Stochasticity
- Variational deep image prior

Blurred image is convolution of sharp image and point spread function (PSF) (assuming space-invariant PSF)

$D = X \circledast K + n$

Image: A image: A

Algorithms based on Deep Image Prior outperform bayesian methods...

돈 돈 돈

- Structure of a neural network is a "prior" for the clean image.
- Operates without any training dataset!
- Denoising, superresolution, inpainting.
- Variants of U-net convolutional network.

Sharp image priors

DIP prefers smooth images

Figure: Comparison of the speed of learning of a sharp image, a blurred image, and an image with artifacts displayed on the right side of the figure.

Low frequencies are learned faster

Frequency in an image = speed of change in pixel intensities \rightarrow details are high frequency information

Why should DIP be useful for blind image deconvolution?

→ < ∃ →</p>

э

Good starting point

PSF initialized as a constant array

$$\mathcal{L}(\boldsymbol{\theta}_{k},\boldsymbol{\theta}_{x}|\boldsymbol{x}) = \alpha \mathcal{L}_{BID}(\boldsymbol{\theta}_{k},\boldsymbol{\theta}_{x}) + (1-\alpha) \mathcal{L}_{Unet}(\boldsymbol{\theta}_{x}|\boldsymbol{x}),$$

Initialization of PSF - 500 iterations with α = 0.9

No-blur target:

Ground-truth target:

Blind Image Deconvolution	DIP 0000	DIP in BID ooooooo●	Stochasticity 000	Sharp image priors

DIP does not act as a prior distribution, the combination of DIP and optimization simply finds a good path towards the solution.

How to regularize it better?

æ

æ

・ロト ・回ト ・ ヨト・

Bayesian regularization of SelfDeblur

- SelfDeblur can be interpreted as the MAP approach with uniform priors for both the sharp image and the PSF
- SelfDeblur is sensitive to hyperparameters
- Adding TV-regularization of the U-net output to the loss function has been somewhat unsuccessful

• (1) • (1) • (1)

Combination of DIP and traditional sharp image prior 3 in variational Bayes

- Sparse prior
- Extreme-channel prior
- DIP used for the sharp image
- Optimization of ELBO

Conclusion				

DIP is not a prior for the sharp image in BID - combination of DIP and optimization finds a good path towards the solution and does not get stuck in an unpleasant minima.

Even though deep neural networks improve the reconstruction they need to be regularized as well \rightarrow we are going back to the traditional methods
